A) THEORY

1) Define a cell in MS-Excel.

= A cell in Microsoft Excel is the box formed by the intersection of a row and a column.

2) Draw and label the blueprint (interface) of Microsoft Excel.

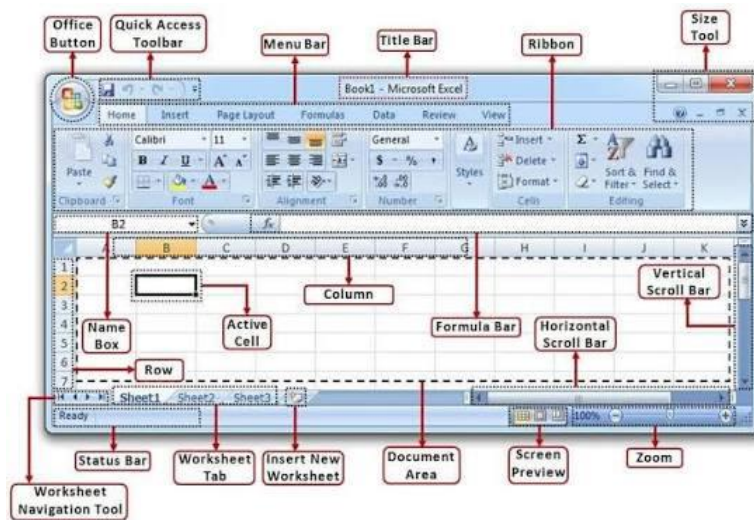

Figure 4.1 1 Structural Blueprint of the Microsoft Word User Interface

3) Define Relative Cell Reference with one example.

= A relative cell reference is a cell reference that changes automatically when a formula is copied or moved to another cell. For example, if a formula contains $=A1+B1$ and is copied one row down, it changes to $=A2+B2$.

4) Define Mixed Cell Reference with one example.

= A mixed cell reference is a cell reference in which either the row or the column remains fixed, while the other changes when the formula is copied. For example, $=A1$ keeps column A fixed while the row can change.

5) Define Absolute Cell Reference with one example.

= An absolute cell reference is a cell reference in which both the row and column remain fixed when the formula is copied to another cell. For example, $=A$1$ keeps both column A and row 1 fixed.

6) Define VLOOKUP.

= VLOOKUP is a function in Microsoft Excel used to search for a value in the first column of a table and return the related information from another column in the same row.

7) Write the syntax of VLOOKUP and explain each argument with an example.

= The syntax of VLOOKUP is =VLOOKUP(lookup_value, table_array, col_index_num, [range_lookup]) .

Here, lookup_value = The value that we want to search for.

Table_array = The range of cells containing the data

Col_index_num = The column from which we want to get the result.

Range_lookup = It is used to choose between approximate value or exact value.

Example: VLOOKUP(A2,'Mark Sheet'!A2:S11, 2, 0)

B) Practical

C) Lab Activities reflections

Day 5: On the 5th day of our lab, we efficiently learned about MS-Excel and different formulas related to it. On the first period of lab, our teacher explained us about our project work very briefly and made us clear about what to do, and what to not do. After informing us about our project work, we learned how to make bills in MS-Excel, and we learned about spreadsheet software, and its types and tabs as well. On the 5th day, we got to learn about many things related to MS-Excel.

Day 6: On the 6th day of our lab, we didn't go to computer lab, but instead went to PTA lab, where learned about many other things about MS-Excel that we hadn't covered on Day 5 of our lab. We learned how to make Mark sheets, and we also learned about VLOOKUP, and its syntax. We practically made the Mark sheets of 10 different students, and also calculated their Grade, Percentage, GPA, Rank and remarks using MS-Excel formulas. We also learned how to use VLOOKUP, and also made another separate mark sheet of all the students separately using it. Overall, on the 6th day, we learned about VLOOKUP, and many other formulas of MS-Excel.

D) Conclusion

In summary, we have so far learned many things from our lab activities. We learned about MS-Word and its tools, features, uses, etc and also did project works that helped us to enhance our knowledge related to MS office package. After MS-Word, we went towards MS-Excel and learned about spreadsheet software, and many formulas and VLOOKUP. Basically, we have nearly completed more than half of MS office package because of our regular lab activities.
